

Storage | Docs | HERY

All the entities are stored in two possible places:

- The root of a project
 - `{project root}/.hery/`
- The home directory:
 - Unix: `~/.hery/`
 - Windows: `{APPDATA}\Hery\`

Inside the storage directory `.hery/` the next layer of directories are of collections.

Example of a storage structure:

- `.hery/` - The root of the storage for collections of entities
 - `collection/` - All collections are stored inside this directory
 - `amadla/` - An example of a collection
 - `entity/` - All the entities are stored inside of this directory
 - `github.com/` - From this point forward the path to the entity is broken down into directories
 - `AmadlaOrg/`
 - `Entity@v1.0.0/` - Entity name with the version
 - `.amadla/` - The directory is always named after the collection
 - `schema.hery.json` - The schema for the entity
 - `amadla.hery` - Is an entity with data, normally used to define an entity
 - `EntityApplication@v1.0.0/` - This is just another entity
 - ...
 - `amadla.cache` - The [SQLite](#) caching
